

1
2 What is claimed is:

3
4 1. A system for providing a remote support service between at least one
5 support-service provider's site and a customer's site having a customer's information
6 technological (IT) infrastructure, comprising:

7 an information collecting component which collects information about the
8 customer's IT infrastructure;

9 a storage component which stores collected information according to a data
10 model modeling at least part of the customer's IT infrastructure;

11 an information-transferring component capable of transferring at least part of
12 the collected or stored information or a representation of it to the support-service
13 provider;

14 an analysis component which analyzes the stored or transferred information or
15 representation as a basis for the provision of the remote support services.

16
17 2. The system of claim 1, wherein the storage component is located at least
18 at one of the customer's site and the support-service provider's site.

19
20 3. The system of claim 1, wherein the analysis component is located at least
21 at one of the customer's site and the support-service provider's site.

22
23 4. The system of claim 1, further comprising a consolidator component which
24 is capable of generating a consolidated representation of the collected or stored
25 information, said consolidator component is located at least at one of the customer's
26 site and the support-service provider's site.

27
28 5. The system of claim 1, wherein the customer's IT infrastructure comprises
29 at least one of the following elements: network infrastructure elements, storage
30 systems, hardware elements and peripherals, operating systems, networking
31 software, database software, middleware and utilities, software applications; and

1 wherein the information collecting component collects information about at least one
2 of these elements and the data model models at least part of these elements and
3 their inter-relations.

4

5 6. The system of claim 1, further comprising a discovery component capable
6 of automatically discovering changes in the customer's IT infrastructure, and wherein
7 the data model is automatically adapted so that it models the changed IT
8 infrastructure.

9

10 7. The system of claim 6, wherein, due to the automatic discovering
11 capability of the discovery component, after an installation of a program code
12 representing the software parts of the information collecting component, the
13 storage component and the information-transferring component at the customer's
14 site, the system automatically discovers at least part of the customer's IT
15 infrastructure and automatically generates a data model which models it.

16

17 8. The system of claim 1, wherein, in the database component, the
18 elements of the customer's IT infrastructure are mapped to classes, and wherein new
19 classes can dynamically be added, and wherein the classes have flexible attributes
20 which can be dynamically added and changed.

21

22 9. The system of claim 1, wherein the information-transferring component
23 is capable of transferring the collected or stored information or a representation of it
24 via an information network, particularly the Internet, to the support-service provider,
25 or by means of a data carrier.

26

27 10. The system of claim 1, wherein the database component stores at least
28 one of configuration and performance history information of the customer's IT
29 infrastructure.

30

31 11. The system of claim 1, wherein the analysis component monitors or

DEUTSCHE PATENT- UND MARKENOFFICE

1 analyzes at least one of configuration, configuration changes, performance and
2 performance changes of the customer's IT infrastructure.

3
4 12. The system of claim 1, wherein the information collecting component
5 comprises a scheduler which schedules the collection of the information about the
6 customer's IT infrastructure.

7
8 13. The system of claim 1, wherein the collection strategy or schedule is
9 determined individually for the customers, depending on the particular support
10 service contract between the customer and the support-service provider.

11
12 14. A computer system forming a customer based part of a system for
13 providing a remote support service between at least one support-service provider's
14 site and the customer's site having a customer's information technological (IT)
15 infrastructure, comprising:

16 an information collecting component which collects information about the
17 customer's IT infrastructure;

18 a storage component which stores collected information according to a data
19 model modeling at least part of the customer's IT infrastructure;

20 an information-transferring component capable of transferring at least part of
21 the collected or stored information or of a consolidated representation of it to the
22 support-service provider.

23
24 15. A computer program product including program code for execution
25 on a customer-based computer system which is part of a system for providing a
26 remote support service between at least one support-service provider's site and the
27 customer's site having a customer's information technological (IT) infrastructure, said
28 program code comprising software parts of:

29 an information collecting component which collects information about the
30 customer's IT infrastructure;

31 a storage component which stores collected information according to a data

1 model modeling at least part of the customer's IT infrastructure;
2 an information-transferring component capable of transferring at least part of
3 the collected or stored information or of a consolidated representation of it to the
4 support-service provider.

5

6 16. A method for providing a remote support service between at least one
7 support-service provider's site and a customer's site having a customer's information
8 technological (IT) infrastructure, comprising the steps of:

9 collecting information about the customer's IT infrastructure;
10 storing collected information according to a data model modeling at least part of
11 the customer's IT infrastructure;
12 transferring at least part of the collected or stored information or a
13 representation of it to the support-service provider;
14 analyzing the stored or transferred information or representation as a basis for
15 the provision of the remote support services.

16
